Summary

A simple tool to help find the Z and Y offset for your Cartographer probe.

3D Printers > Other Printer Parts & Upgrades

Tags: cartographer

This simple tool helps find the proper offset for your Cartographer probe in relation to your nozzle tip.
Having a 2.6-3mm Z offset is critical for reliable operation of Cartographer Touch (nozzle probling).
The Y offset ruler is just a helpful addition.
To use, simply print the parts (they are already in proper printing orientation in the .3mf file) and then clip the “flower” onto the “ruler” then slide the “ruler” into the base.
Then simply remove your cartographer from your mount and replace it with the tool. Slide the ruler until the flower is underneath the nozzle, then rotate the flower until one of the faces is touching the nozzle.
The numbers on the flower indicate your Z offset, and the ruler mark that lines up with the base indicates your Y offset (you can also use calipers to measure from the back face of the flower to the front face of the base and this will also be your Y offset).
